

CLINICAL PRESENTATION MTS_0481

REASON FOR VISIT

Emergency department visit for a 2-month-old infant with nine days of cough and increased work of breathing.

HISTORY

Cough began nine days ago and worsened gradually, with reduced oral intake over the past three days. No fever. The picture is a classic clinical bronchiolitis.

EXAM & ASSESSMENT

Comfortable on nasal suctioning and supplemental oxygen as needed. Bronchiolitis is a clinical diagnosis; per AAP and Choosing Wisely, routine viral testing, chest radiographs, and laboratory studies are not indicated and do not change management.

PHYSICIAN

treating clinician

Diagnosis
Acute bronchiolitis

Diagnostic orders
Supportive care
No diagnostic tests ordered.

Appropriate care:
no testing indicated.
